Live portfolio import:

Csv attached

Number for NAV (manual input)

Live Portfolio Risk

Add:

- Table, Pie charts/bar charts for gross and net exposure by sector and country and region
- Table with:
 - o Total position count
 - o Average position count per theme
 - o Max theme size
 - o Max position size
- Automatic calculation of gross and net beta adjusted exposure per position, theme, sector, country (2 year trailing beta to S&P)
- Add country and sector to main table
- Add actual exposure to main table (from live position import)
- Portfolio optimizer tool (can use an available model) to suggest weightings for themes

Risk Monitor

The metrics are awesome, we just need to make sure they reflect the live portfolio!

Max Drawdown: How is it calculated?

Beta adjusted net: What is time horizon and index?

Add:

- Correlation matrix: Correlation by position theme - how is it calculated? Trailing?
- Factor tab: Factor exposure by theme and position: 10Y data: value, size, momentum, quality, invest (Fama French 5 + momentum)
- Per position: 5Y max DD, skew, kurtosis
- Scenario tab: Add methodology as note; adjust the scenario methodology so that it increases correlation assumptions for scenarios
 - o Add GFC, European Debt Crisis, Black Friday, Hurricane Katrina, Volmageddon as additional scenarios - + most popular risk scenarios - also increase correlation assumptions
- Liquidity
 - o Days to liquidate based on 15% VWAP

PnL

- Can we add theme and portfolio alpha using different alpha measures:
 1. Vs. benchmark (currently use)
 2. Vs. Beta adjusted exposure
- Add alpha to beta adjusted exposure to main table
- Add sorting function to main table
- Add company name to main table
